- 11. Appendices

1. Executive Summary

1.1 Project Overview

The PM Project Tracker is an enterprise-grade **native desktop application** designed to be a comprehensive toolkit for project management at Verizon. Built with PyWebView, it provides a modern, user-centric interface that looks and feels like a true desktop application while leveraging web technologies for the UI. It connects directly to the Golden Source (GS) Oracle Database, delivering unprecedented efficiency gains while maintaining enterprise security standards.

1.2 Key Objectives

• Centralize Project Management: Single pane of glass for all PM activities

- Native Desktop Experience: True desktop application, not browser-based
- No External Dependencies: Single executable with everything bundled
- Seamless Integration: One-click integrations with Slack, Webex, Google Workspace
- Foster Team Collaboration: Task assignment, commenting, and shared visibility
- Modern User Experience: Intuitive, customizable interface
- **Empower with Data**: Custom reporting engine and visual Gantt charts
- Voice Capabilities: Text-to-speech for accessibility and hands-free updates

1.3 Why PyWebView?

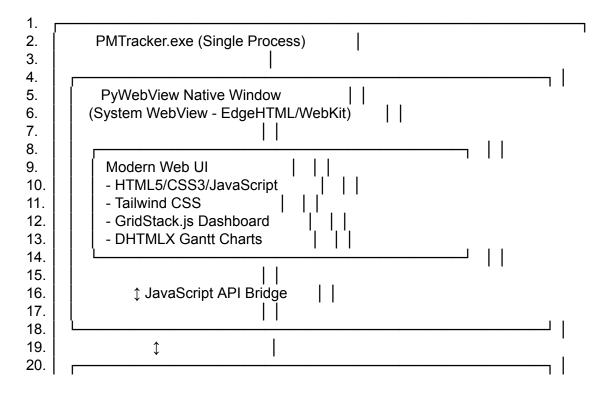

PyWebView was chosen because it:

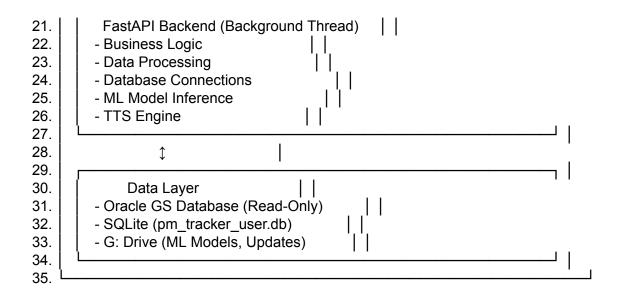

- Creates a native desktop window (not a browser tab)
- Requires no external browser installation
- Bundles into a single executable
- Provides full desktop integration (file dialogs, notifications, system tray)
- Works within Verizon's constraints (no API keys, no external software)
- Maintains modern web UI capabilities

2. System Architecture & Design

2.1 Native Desktop Architecture

The application uses a **simplified two-tier architecture** powered by PyWebView:

Architecture Layers:

1. Presentation Layer (PyWebView Window)

- Native desktop window with embedded web view
- Responsive HTML/CSS/JS interface
- Customizable widget-based dashboard
- Interactive Gantt charts
- Real-time updates via WebSocket

2. Application Layer (Python Backend)

- FastAPI running in background thread
- Business logic and data processing
- Oracle and SQLite database connections
- ML model serving
- Text-to-speech engine
- Auto-updater service

3. Data Layer (Hybrid Storage)

- Golden Source Oracle Database: Primary data source (read-only)
- Local SQLite Database: User-generated content (notes, tasks, settings)
- o **G: Drive**: Shared resources (ML models, updates, documentation)

2.2 User Experience (UX) and Interface (UI) Design

2.2.1 Customizable Dashboard

The main dashboard features a fully customizable, widget-based layout:

Core Widgets:

- KPI Cards (project counts, completion rates, delays)
- Project Lists (filterable by status, PM, team)
- Task Lists (personal and team tasks)
- Analytics Charts (timeline trends, risk distribution)

Utility Widgets:

- World Clock (multiple time zones)
- Local Weather (Azle, TX)
- Quick Links (internal sites)
- Personal Notes

Integration Widgets:

- TCOMS Quick View
- Slack Activity Feed
- Upcoming Meetings
- Recent Documents

2.2.2 In-App Help & Guidance

Contextual Help:

- Tooltip explanations on hover
- Help icons next to complex features
- Inline examples and suggestions

Guided Tours:

- First-time user walkthrough
- Feature discovery prompts
- Interactive tutorials (powered by Shepherd.js)

Central Help Menu:

- Searchable documentation
- Video tutorials (hosted on G: drive)
- FAQ section
- Contact support

2.2.3 Template Engine

Project Note Templates:

- Weekly status updates
- Project kickoff notes
- Closure documentation
- Risk assessments

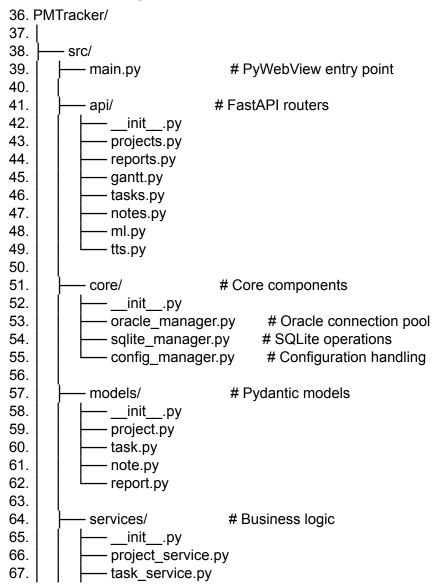

Report Templates:

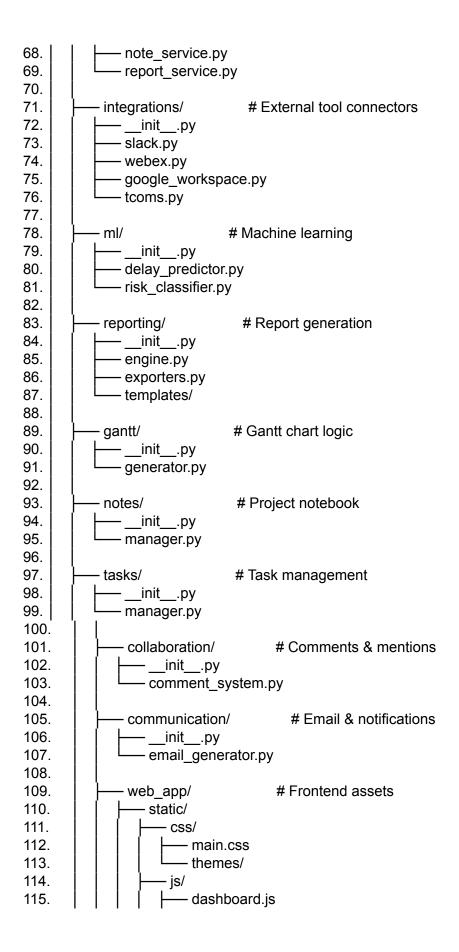

- Executive summary
- Detailed technical reports
- Performance dashboards
- Resource utilization

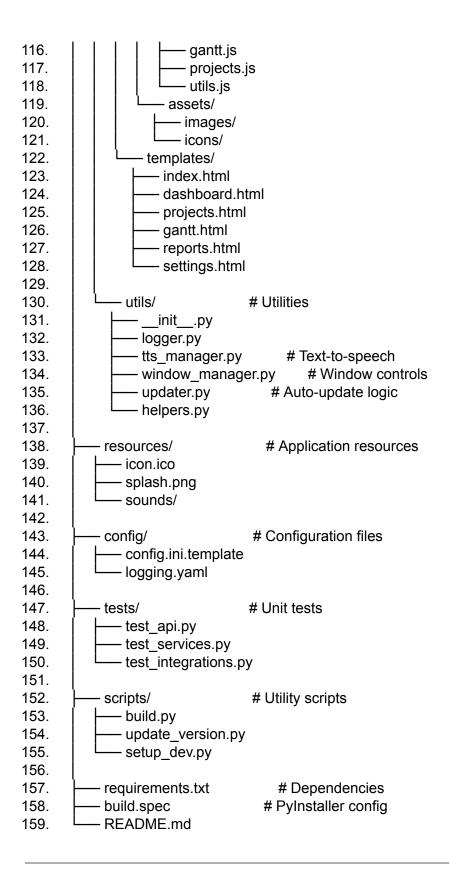

Workflow Templates:

- New project kickoff sequence
- Status update routine
- Escalation procedures
- Handoff checklists

2.3 Modular Project Structure

3. Technology Stack

3.1 Core Technologies

Desktop Framework:

- PyWebView 4.4+: Native window creation and web view embedding
- PySide6: Optional configuration dialogs

Backend:

- Python 3.11+: Application runtime
- FastAPI 0.104+: REST API framework
- Uvicorn 0.24+: ASGI serverPydantic 2.5+: Data validation

Database:

- **oracledb 2.0+**: Oracle database connector (thin mode)
- sqlite3: Built-in Python module for local storage

Frontend:

- HTML5/CSS3/JavaScript (ES6+)
- Tailwind CSS 3.3+: Utility-first CSS framework
- Lucide Icons: Icon library
- GridStack.js 9.0+: Drag-and-drop dashboard
- DHTMLX Gantt 8.0+: Interactive Gantt charts
- Shepherd.js 11.0+: Guided tours
- Chart.js 4.0+: Data visualization

Text-to-Speech:

- gTTS 2.4+: Google Text-to-Speech
- pydub 0.25+: Audio processing
- pywin32: Windows audio playback

Machine Learning:

- TensorFlow/Keras 2.15+: ML framework
- Pandas 2.1+: Data manipulation
- Scikit-learn 1.3+: ML utilities
- NumPy 1.26+: Numerical computing

Utilities:

• **cryptography 41.0+**: Credential encryption

- **python-dotenv 1.0+**: Environment management
- pyperclip 1.8+: Clipboard operations
- Jinja2 3.1+: Template engine
- openpyxl 3.1+: Excel file generation
- reportlab 4.0+: PDF generation

Build & Deployment:

- PyInstaller 6.0+: Executable creation
- win10toast: Windows notifications

3.2 Complete Requirements

```

4. Oracle Database Integration

4.1 Golden Source (GS) Schema Overview

The application connects to the **SPLUNKVEEP_NAR** Oracle user, which hosts the Golden Source (GS) database schema. This schema consolidates data from various Verizon systems into a structured, reliable format organized into logical "layers" by business domain.

Connection Details:

• **Host**: f1btpap-scan.verizon.com

Service: NARPRODUser: splunkveep_nar

• Mode: Thin (no Oracle Client required)

4.2 Key Data Layers & Tables

Laye r	Primary Tables	Description
WFM	GS_WFM_NF_PROJECTS	Core Canvas WFM projects (NFIDs, status, type)
	GS_WFM_NF_PRJ_MILESTONES	Key project milestones
	GS_WFM_UTE_TASKS	UTE task details
	GSC_WFM_NFID_DEPENDENCY_S UMMARY	Project dependencies
ССР	GS_CCP_CCRS	Customer Carrier Requests (CCRs)

	GS_CCP_CCR_QUEUES	VZB Local CCR queues
	GS_CCP_TEOS	Telecommunications Equipment Orders
	GS_CCP_CCR_KEY_MILESTONE_ DATES	Milestone tracking
PMR A	GS_PMRA_PROV_ORDERS	Provisioning order data
DEC O M	GS_DECOM_*	Decommissioning assets and sites
REF	GS_REF_HR_DETAILS	Employee information & hierarchy
	GS_REF_WORKDAY_CALENDAR	Business day calculations
AYS	GS_AYS_TICKETS	AYS ticketing system data
POR C H	GS_PORCH_CUSTOMER_ORDERS	Customer order details

4.3 ETL Architecture and Process

4.3.1 ETL Framework

Data pipelines are built using standardized Python framework:

- Location: gsetl_project/etl/
- **Scripts**: Refresher_*.py (one per data layer)
- **Process**: Extract → Transform (Pandas) → Load (SQL MERGE)

4.3.2 Job Orchestration with Airflow

- **Tool**: Apache Airflow
- **DAGs**: gsetl_project/customized_dags/
- Purpose: Schedule and manage dependencies

4.3.3 Data Refresh Cadence

Layer	Freque ncy	Timing
CCP, WFM, PMRA, PORCH	Daily	Early mornin

```
REF (HR Data)

Daily

Early

mornin

g

DECOM

Weekly

Monday

AYS

4.4 Connection Architecture

Implementation (src/core/oracle_manager.py):

```
208.
       import oracledb
209.
      from contextlib import contextmanager
210.
211.
       class OracleManager:
212.
         def __init__(self, config):
213.
            self.config = config
214.
            self.pool = None
215.
            self._initialize_pool()
216.
217.
         def _initialize_pool(self):
            """Create connection pool"""
218.
219.
220.
              self.pool = oracledb.create pool(
221.
                 user=self.config.oracle_user,
222.
                 password=self.config.oracle_password,
                 dsn=f"{self.config.oracle_host}/{self.config.oracle_service}",
223.
224.
                 min=2,
225.
                 max=10,
226.
                 increment=1,
227.
                 threaded=True
228.
              )
229.
            except Exception as e:
230.
              raise ConnectionError(f"Failed to create Oracle pool: {e}")
231.
232.
         @contextmanager
233.
         def get_connection(self):
234.
            """Get connection from pool"""
235.
            conn = self.pool.acquire()
236.
237.
              yield conn
238.
            finally:
239.
              self.pool.release(conn)
240.
241.
         def execute_query(self, query, params=None):
```

```
"""Execute SELECT query"""
242.
243.
            with self.get_connection() as conn:
244.
              cursor = conn.cursor()
245.
              cursor.execute(query, params or {})
246.
              columns = [col[0] for col in cursor.description]
247.
              results = cursor.fetchall()
              return [dict(zip(columns, row)) for row in results]
248.
249.
250.
         def test connection(self):
            """Test database connectivity"""
251.
252.
            try:
253.
              with self.get connection() as conn:
254.
                 cursor = conn.cursor()
255.
                 cursor.execute("SELECT 1 FROM DUAL")
256.
                 cursor.fetchone()
257.
              return True
258.
            except Exception as e:
259.
              return False
```

4.5 Credential Management

Encryption Implementation (src/core/config_manager.py):

```
260.
       from cryptography.fernet import Fernet
261.
       import os
262.
       import configparser
263.
264.
       class ConfigManager:
265.
         def init (self, config path='config/config.ini'):
266.
            self.config path = config path
267.
            self.key_path = os.path.join(os.path.expanduser('~'), '.pmtracker_key')
268.
            self.cipher = self._get_cipher()
269.
            self.config = self. load config()
270.
271.
         def get cipher(self):
272.
            """Get or create encryption key"""
273.
            if os.path.exists(self.key_path):
274.
              with open(self.key path, 'rb') as f:
275.
                 key = f.read()
276.
            else:
277.
              key = Fernet.generate_key()
278.
              with open(self.key path, 'wb') as f:
279.
                 f.write(key)
280.
            return Fernet(key)
281.
282.
         def encrypt password(self, password):
            """Encrypt password"""
283.
```

```
284.
            return self.cipher.encrypt(password.encode()).decode()
285.
286.
         def decrypt password(self, encrypted password):
            """Decrypt password"""
287.
288.
            return self.cipher.decrypt(encrypted_password.encode()).decode()
289.
290.
         def save_credentials(self, username, password):
291.
            """Save encrypted credentials"""
292.
            config = configparser.ConfigParser()
293.
            config['Oracle'] = {
294.
               'username': username.
               'password': self.encrypt password(password),
295.
296.
               'host': 'f1btpap-scan.verizon.com',
297.
               'service': 'NARPROD'
298.
            }
299.
            with open(self.config path, 'w') as f:
300.
              config.write(f)
301.
302.
         def get credentials(self):
303.
            """Get decrypted credentials"""
304.
            config = configparser.ConfigParser()
305.
            config.read(self.config_path)
306.
            return {
               'username': config['Oracle']['username'],
307.
               'password': self.decrypt password(config['Oracle']['password']),
308.
309.
              'host': config['Oracle']['host'],
              'service': config['Oracle']['service']
310.
            }
311.
```

5. Application Components

5.1 Main Application Entry Point

src/main.py - PyWebView initialization:

```
312.
       import webview
313.
       import threading
314.
       import sys
315.
       import os
316.
       from pathlib import Path
317.
318.
       # Add src to path
319.
       sys.path.insert(0, str(Path( file ).parent))
320.
321.
       from api import create app
```

```
322.
       from utils.window manager import WindowManager
323.
      from utils.updater import check_for_updates
324.
      from core.config_manager import ConfigManager
325.
      import uvicorn
326.
327. class PMTrackerApp:
328.
         def __init__(self):
329.
           self.window = None
330.
            self.api = None
           self.config = ConfigManager()
331.
332.
333.
         def start backend(self):
            """Start FastAPI in background thread"""
334.
335.

9.2 Installation Process

For End Users:

- Navigate to G:\Shared drives\TEAM-BAU\tracker\releases\
- 2. Copy PMTracker.exe to local folder (e.g., C:\Apps\PMTracker\)
- 3. Double-click PMTracker.exe to launch
- 4. First-time setup wizard appears:
 - Enter Oracle credentials
 - Test database connection
 - Configure preferences
- 5. Application opens in native window

First-Time Setup Wizard (src/config/setup_wizard.py):

```
2040. import webview2041. from core.config_manager import ConfigManager2042. from core.oracle_manager import OracleManager2043.
```

```
2044. class SetupWizard:

10. Development Setup

10.1 Prerequisites

- Windows 10/11
- Python 3.11+
- Git
- Visual Studio Code (recommended)
- Access to Verizon network and Oracle database

10.2 Environment Setup

```
2256. # 1. Clone repository2257. git clone <repository_url>2258. cd PMTracker2259.2260. # 2. Create virtual environment
```

```
2261. python -m venv venv
2262.
2263. # 3. Activate environment
2264. venv\Scripts\activate
2265.
2266. # 4. Upgrade pip
2267. python -m pip install --upgrade pip
2268.
2269. # 5. Install dependencies
2270. pip install -r requirements.txt
2271.
2272. #6. Copy config template
2273. copy config\config.ini.template config\config.ini
2274.
2275. #7. Edit config.ini with your credentials
2276. notepad config\config.ini
2277.
2278. #8. Initialize local database
2279. python scripts\init db.py
2280.
2281. # 9. Run application in development mode
2282. python src\main.py
```

Appendix D: API Reference

Projects API

2524. GET /api/projects - List all projects (with filters)

2525. GET /api/projects/{id} - Get project details

2526. POST /api/projects/{id}/notes - Add project note

2527. GET /api/projects/{id}/tasks - Get project tasks

Reports API

2528. POST /api/reports/build - Build custom report

2529. POST /api/reports/export - Export report (PDF/Excel)

2530. GET /api/reports/performance - Performance summary

Gantt API

2531. GET /api/gantt/data - Get Gantt chart data

2532. POST /api/gantt/dependencies - Update dependencies

Tasks API

2533. GET /api/tasks - List tasks (filtered) 2534. POST /api/tasks - Create new task

2535. PUT /api/tasks/{id} - Update task 2536. DELETE /api/tasks/{id} - Delete task

Notes API

2537. GET /api/notes/{project_id} - Get project notes

2538. POST /api/notes - Create note 2539. PUT /api/notes/{id} - Update note 2540. DELETE /api/notes/{id} - Delete note

2541. GET /api/notes/search - Search notes

ML API

2542. POST /api/ml/predict/delay - Predict project delay

2543. POST /api/ml/classify/risk - Classify project risk

2544. GET /api/ml/models/status - Get ML models status

TTS API

2545. POST /api/tts/speak - Text-to-speech 2546. POST /api/tts/stop - Stop speaking 2547. GET /api/tts/status - Get TTS status

```

Appendix G: Troubleshooting Guide

Issue	Possible Cause	Solution
Application won't start	Port 8000 already in use	Close other apps using port 8000
Database connection fails	Incorrect credentials	Run setup wizard again
White screen on launch	Frontend files missing	Rebuild application with all assets
TTS not working	Audio output not available	Check sound settings
Auto-update fails	G: drive not accessible	Check VPN/network connection
ML predictions fail	Models not found on G: drive	Verify G: drive path and model files
Slow performance	Too many widgets on dashboard	Remove unused widgets
Gantt chart not loading	No project data	Verify database query returns data

Appendix H: Performance Optimization Tips

1. Database Queries

- Use connection pooling (already implemented)
- Add indexes for frequently queried columns
- Limit result sets with WHERE clauses

2. Frontend Performance

- Lazy load widgets
- Use pagination for large lists
- Implement virtual scrolling

3. Memory Management

- Close database connections properly
- Clear cached data periodically
- Limit ML model memory usage

4. Network Optimization

- Cache static assets
- Compress API responses
- Use WebSocket for real-time updates

Conclusion

This PyWebView-based PM Project Tracker provides a **comprehensive**, **native desktop solution** that:

Works within your constraints:

- No external browser required
- No API keys needed
- No additional software installation
- Single executable deployment

✓ Delivers enterprise features:

- Direct Oracle database integration
- Advanced reporting and analytics
- Interactive Gantt charts
- Team collaboration tools
- ML-powered predictions
- Text-to-speech accessibility

✓ Provides seamless integrations:

- Slack (message formatting + deep links)
- Webex (calendar integration)
- Google Workspace (Docs, Sheets, Gmail)
- All via desktop automation and clipboard

M Ensures easy maintenance:

- Auto-update mechanism
- Centralized deployment via G: drive
- Modular architecture
- Comprehensive logging
